

IN THE DRAWINGS

Please amend Figures 4 and 6 per the attached annotated copies of Figures 4 and 6 and wherein the changes are noted in red. No new matter is believed entered with the proposed changes. Applicant requests the examiner to defer the submission of replacement drawings until allowable subject matter has been indicated.

The amendments do not include the callout reference to the unnumbered O'ring and to which the examiner objected. Applicant believes the examiner is incorrect that such members are not understood by those skilled in the art to be O'ring seals and not supported from the original specification as being seals but has acquiesced to reduce the appeal able issues if allowable subject matter is not indicated upon review of the subject response.

Applicant particularly believes the excluded seals are supported from the description of paragraphs 0063, 0048, 0049 et al. and wherein applicant discusses the alternative use of either a compressed air atomizing nozzle or a high pressure oil nozzle with the invention. Passageways 40-42 are used with the air atomizing nozzle. The air passageways 40-42 can either be omitted or are blocked with the use of a high pressure oil nozzle. Figure 6 also clearly depicts that the "unnumbered" darkened member spans the channel/cavity 26 and extends across the entire width of the air atomizing nozzle 2. Moreover, those skilled in the art clearly appreciate air atomizing nozzles include a seal as indicated.
